**INTERPRETATION**

In typhoid endemic areas, active typhoid is suggested if the titers of H or O or both agglutinins are significantly raised.(i.e. titers greater than 1 in 160 ).

A rising titer, however must be looked for because titers greater than 1 in 200 can occasionally occur in non typhoid conditions such as vaccination with TAB, infection with other salmonella species, chronic liver disease and immunological disorders such as Rheumatoid arthritis, Rheumatic fever, multiple myeloma, Nephrotic syndrome and Ulcerative colitis.
